

TRIMIT PRODUCT CONFIGURATION & MANUFACTURING

When working with production of customizable products, creation and handling of BOM (Bill of Material) is often very comprehensive and time consuming. Furthermore, if the BOM is not correct, detailed and updated it will inevitably result in numerous errors in both material consumption and cost calculation.

TRIMIT Product Configuration reduces the number of BOMs significantly, due to the use of master BOMs and generic item BOMs, making it very simple to create and maintain BOMs. The formula calculator is a tool that controls the BOM creation, by using logical expressions for calculating, routing, material- and time consumption, etc.

This tool enables you to set up all the necessary conditions in order to control what can and cannot be configured. This way, your sales persons can only configure what you allow them to, which minimizes errors remarkably, and by using the configuration all relevant specifications for both production and purchase are generated automatically. This moreover, reduces the bottlenecks that often occur when handling special orders and gives you a very quick turnaround on orders.

TRIMIT Product Configuration combines calculation of actual prices and standard cost prices. The prices are continuous all the way from supplier order through BOM to the sales lines, giving all involved employees a complete overview over the prices, costs and contribution margins of all products.

Furthermore, TRIMIT Product Configuration automatically recalculates and deletes orders, which means that

cancellation of orders removes all related orders, prices etc. while adjustments of orders lead to an automatic recalculation of everything involved in the order. This way reducing time spent on errors and bottlenecks remarkably.

TRIMIT Production is fully integrated with your entire ERP-system making it possible to calculate cost- and sales prices in the moment of configuration. This improves customer service significantly as customers get answers to e.g. price requests instantly.

BENEFITS

- Online calculation at order entry
- Handling of variants and dimensions throughout the entire solution
- Variant outcomes dependent on customer-, country- of basic item data
- Product configuration – control of individual item qualities at the order stage
- Optimization of order handling process
- Easy creation and maintenance via masters
- Unlimited variants and dimensions.
- Possibility of Data Capture
- Capacity planning
- Online control of bottlenecks throughout order processing
- Automatic creation of production orders with relation to customer orders
- Combination of actual cost prices and standard cost prices
- Search based on technical specifications
- Directly integrated with Microsoft Dynamics NAV
